## Additional Insights

I understand you have a fever. I am an AI and cannot provide medical advice. It is important to consult a healthcare professional for diagnosis and treatment. Here are some general steps you can take:

- Check your temperature: Use a thermometer to confirm you have a fever (generally considered 100.4 F or 38 C or higher).
- Rest: Get plenty of rest to allow your body to recover.
- Stay hydrated: Drink plenty of fluids like water, clear broths, or electrolyte solutions to prevent dehydration.
- Over-the-counter medication: Consider taking over-the-counter medications like acetaminophen (Tylenol) or ibuprofen (Advil, Motrin) to reduce fever and relieve discomfort, but follow the instructions on the label.

If you experience any of the following symptoms, seek immediate medical attention:

- High fever (over 103 F or 39.4 C)
- Severe headache
- Stiff neck
