Additional Insights

I understand you have a fever. That's not fun! Since I can't give medical advice, here's what I can suggest you do:

- Check your temperature: Make sure you have a reliable thermometer and know how to use it correctly. This will help you know how high your fever is.
- Stay hydrated: Drink plenty of fluids like water, broth, or electrolyte drinks.
- Rest: Your body needs rest to fight off whatever is causing the fever.

Consider over-the-counter medications: If you're comfortable and able to, medications like acetaminophen (Tylenol) or ibuprofen (Advil) can help reduce fever. Always follow the dosage instructions on the label.*

- Contact a doctor:
- If your fever is very high (e.g., over 103 F or 39.4 C).
- If you have other symptoms like a severe headache, stiff neck, difficulty breathing, confusion, or a rash.
- If your fever lasts for more than a few days.
- If you have any underlying medical conditions.

I hope you feel better soon!
